

Secure age verification for regulated automated retail

Privacy-by-design verification of legal age and identity for self-service sales in regulated sectors.

Initial use case: licensed tobacco retail in Spain

B2B compliance layer

PROBLEM

Regulated automated sales need stronger controls

Age risk

Restricted products require reliable majority-of-age verification before purchase.

Audit risk

Operators need evidence of compliance without storing excessive personal data.

Operational friction

Manual checks add cost, queues and inconsistent customer experience.

Regulatory uncertainty

Unattended or semi-attended sales require careful legal and privacy framing.

SOLUTION

A modular verification layer for kiosks and self-service terminals

**Document
interface**

**Certificate
validation**

**Liveness + face
match**

Age decision

Audit-safe result

Approved / rejected / auditable outcome — without retaining unnecessary PII.

Compliance value for multiple stakeholders

Retailers

Reduce compliance risk and improve controlled self-service flows.

Regulators

Traceable process, clear failure modes and privacy-first audit design.

Hardware partners

Differentiated compliance feature for vending and kiosk systems.

Three-layer product architecture

1. Verification engine

Age decision, matching logic,
audit token and session lifecycle.

2. Integration layer

NFC reader, camera/liveness
SDK, kiosk software, payment
and dispenser systems.

3. Compliance layer

Audit dashboard, reporting,
privacy flow and incident
records.

PROOF OF CONCEPT

Current technical assets

Code coverage

0 PII

Stored in audit logs

Python workflow, simulated demo, touchscreen mockup, architecture notes and business validation package.

Validate before building expensive hardware

- Legal feasibility consultation: Comisionado + RGPD.
- 10–20 customer discovery interviews with estancos and vending operators.
- Partner with kiosk/vending manufacturer for hardware pilot.
- Package as licensing + SaaS compliance dashboard + support.

Next step: pilot-ready validation package

Funding use

Legal review, DPIA, hardware prototype, biometric SDK evaluation, security review and customer discovery.

Funding path

ENISA Emprendedoras Digitales, INCIBE, CDTI/NEOTEC, hardware partner and accelerator after validation.

Ask: support to validate legal feasibility and build a pilot-ready MVP with one industry partner.
